

The solution is delivered as a SharePoint-based application portal - made up of "solution kits" that sit within a content-centric and quality-embedded foundation. A solution kit is composed of the following:

- Starter SharePoint templates (sites, creation wizards, forms, etc)
- Standardized data-structures, data-mappings, content-types, and workflows
- Custom SharePoint components
- Example site with test data
- Full system documentation and SDK-level guides

Each solution-kit is focused around a specific business area - with the "Contract Lifecycle" solution providing the base-level functionality. The diagram below illustrates the relationship between the foundation: Quality, Content, and Application lifecycles - and the contract-related solution-kits.
